

UH-60L Operational Flight Trainer

The UH-60L OFT immerses aircrews in mission scenarios

In 2021, CAE acquired L3Harris' Military Training business, which included Link Simulation & Training and Doss Aviation. These businesses are now integrated with CAE USA as part of CAE's Defense & Security business unit.

Overview

The UH-60L Operational Flight Trainer (OFT), offers a high-fidelity environment that immerses aircrews in mission scenarios that support a robust training experience. Aircrews are able to gain training on full operational and employment skills, including environmental and threat conditions that could be encountered in the real world.

Spatially and physically accurate cockpit

The UH-60L OFT accurately simulates the UH-60L Black Hawk helicopter and the mission environment it operates in by providing a cockpit that is spatially accurate in physical and functional features. The OFT cockpit contains instrumentation, control and display devices that replicate the equipment and configuration of the actual UH-60L cockpit to ensure a realistic flight training environment.

Direction and movement of the controls and switches and the accurate simulation of the navigation, communication, aural cueing, motion cueing and visual system provides an environment that allows student pilots to become totally immersed in training tasks. All panel backlighting is provided with controls and the cockpit contains an over-the-shoulder cross-cockpit video camera that records all cockpit activity for after action review for all day, night, and night vision goggle (NVG) operations.

Motion / vibration cueing system

The UH-60L OFT cockpit will be installed on a three degrees-of-freedom (DOF) vibration platform that provides high-frequency vibration cues associated with helicopter flight. The vibration platform is then mounted on a six DOF electric motion system, which eliminates environmental issues associated with legacy hydraulic motion systems. The motion system will provide cueing for normal flight, highly dynamic maneuvering flight, emergency conditions, as well as reflecting atmospheric disturbances including winds and gusts. Cues will be provided for ground or surface contact, effects of weapon impacts on the ownship, sling load operations and deployment of personnel.

Key facts

- #1 provider of rotary-wing simulators to the U.S. Military
- World's only UH-60L full flight simulator
- 16 Systems currently fielded and in operation for U.S. and International customers

Visual display system

The UH-60L OFT is integrated with a 200-degree horizontal by 45-degree vertical out-the-window (OTW) visual system display. A full complement of vehicles; troops; immobilized vehicles; in-flight missiles and projectiles; animation and special effects; threat air defense units; and tactical smoke combine to support training on a virtual battlefield under a full range of environmental and battlefield conditions. The displayed images depict the speed, path, and attitude of the simulated models.

High fidelity flight and communication models

Flight dynamics and engine models respond to all required flight and power plant controls and simulated environmental conditions (such as temperature, pressure, winds, and turbulence) in accordance with the aircraft performance data. The high-fidelity blade element flight model includes modeling of variation in gross weight, inertias, center of gravity position, fuel, cargo load, sling load and personnel loading.

The UH-60L OFT communication systems provide the functionality required to support all communication system training tasks. This includes the cockpit communication system controls, panels, switches, indicators, displays and helmet connections. All radio simulation is capable of communication across the real-time network to provide interoperability with any other networked simulator or IOS role player containing compatible radio simulations.

Virtual battlespace environment

Semi-Automated Forces (SAF) will provide a realistic, tactically-correct battlefield training environment. The SAF simulates friendly and opposing aerial and ground weapon system in day, night, adverse weather, selectable environmental conditions (temperature, wind, visibility, and ceiling), battlefield obscurants, dynamic terrain, obstacles and weapon flashes. Training exercises are conducted in tactical, target-rich, interactive virtual environments that are correlated to the visual system. The UH-60L OFT provides its own synthetic environment (SE) for stand-alone operation and is able to interoperate with the synthetic environments of other OFTs or compatible simulation selected to be in the same exercise.
